tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the

low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the texture of the reconstructed images in the frequency domain with a dedicated loss low dose computed tomography reduces the radiation exposure of patients while the image noise increases and the network learns to restore the
