

A Physical-Flow-Based Approach to Allocating Transmission Losses in a Transaction Framework

The proposed allocation scheme assigns the total system losses to every transaction in proportion to its flow; the loss of transaction l_{ij} , which is computed below, is always nonnegative and the sum over all transactions equals the total loss L of the system as a whole.

$$l_{ij} = \frac{f_{ij} L}{\sum_{i,j} f_{ij}} \tag{1}$$

After the equation the text continues as a normal paragraph of body text so that the layout has more than one paragraph on the page.
